

****Note: Make sure you have a good backup of your iPhone before you try this. THIS HAS POTENTIAL TO BRICK YOUR PHONE....THAT MEANS RENDERED UNUSABLE SO IF YOU ARE WORRIED ABOUT DOING THIS THEN DON'T TRY IT IF YOU SCREW IT UP ITS NOT MY FAULT. IF YOU RUN INTO PROBLEMS POST IN THE FORUMS, MAKE SURE YOU READ AND UNDERSTAND ALL THE STEPS BEFORE STARTING.**

How to make your magicjack account work on your iPhone? This will be step by step on how to

1. Jailbreak the iPhone
2. Install sip application
3. Dump your sip information
4. Configure your sip application

First to make this work what we will need to do is jail break your iPhone this is completed very simply you need to go to this site <http://blackra1n.com> and download the latest version of GEOHOT's software. Also keep in mind if this software works well for you go back and donate to him he is a very talented coder and spent a lot of time on this jailbreaking tool.

*****note if you rely on software unlock for cell phone service then do not upgrade to the newest iPhone firmware 3.1.2. This will cause the baseband to upgrade and you will lose the unlock.***

Some of you may be asking what exactly is jailbreaking? Jailbreaking is a process that allows the user to install unsigned code on an iPhone. It also allows pirated iPhone apps to be installed we are not going to be going over how to do that here just wanted to let you know the full capabilities.

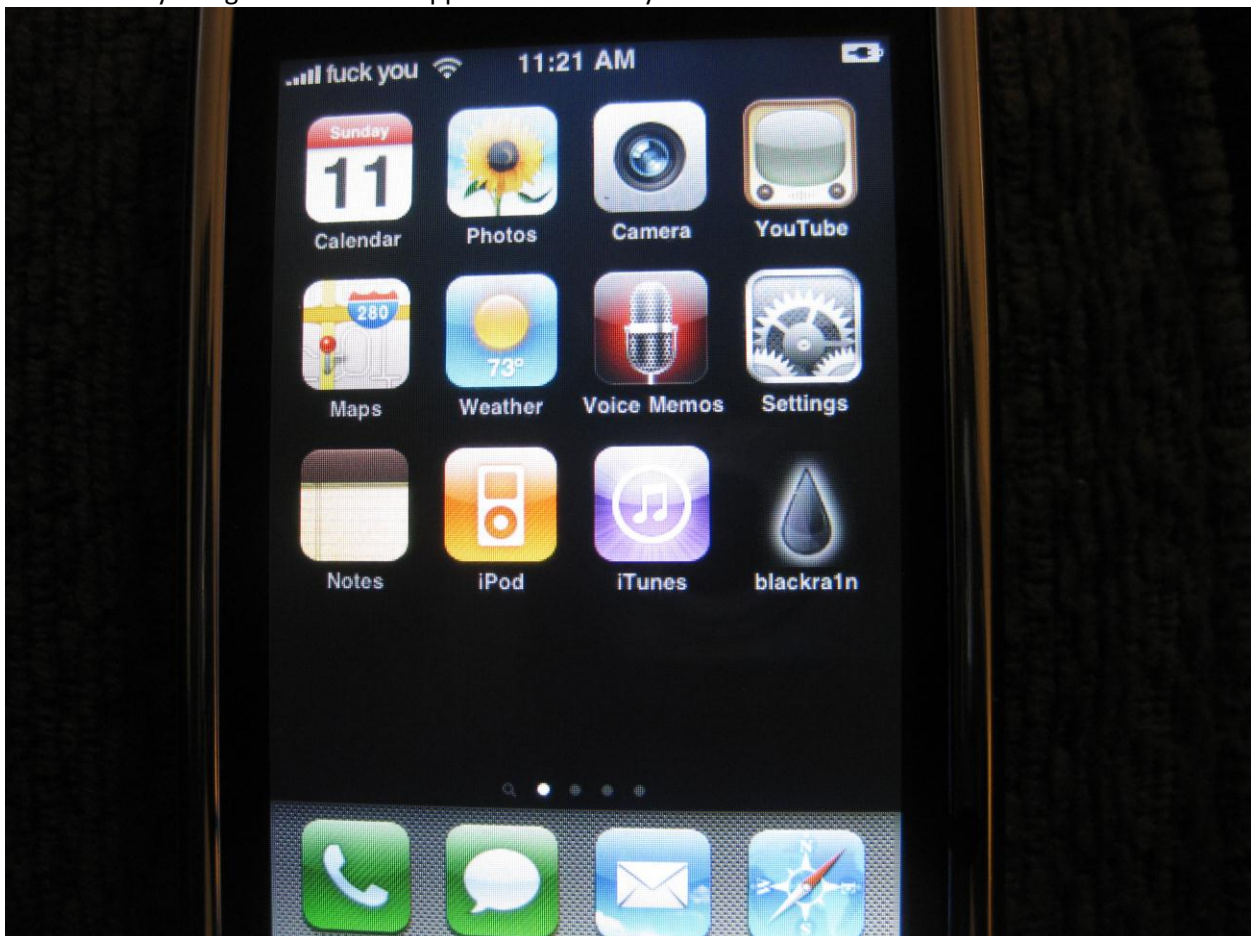

Blackra1n was a little tricky for me to get working on my iPhone 3g here are the steps that I had to take to allow this program to work on the my iPhone. Please before you try the steps below simply just try and run the program blackra1n on its own with iTunes closed only use these steps below if you run into programs.

*****Note: Also if you run into problems with your iPhone locking up or whatever all you need to do is hold down the home button(the circle one) and the power button (the one on top) This will hard reset the iPhone. Then just use the power button to turn it back on and try again.***

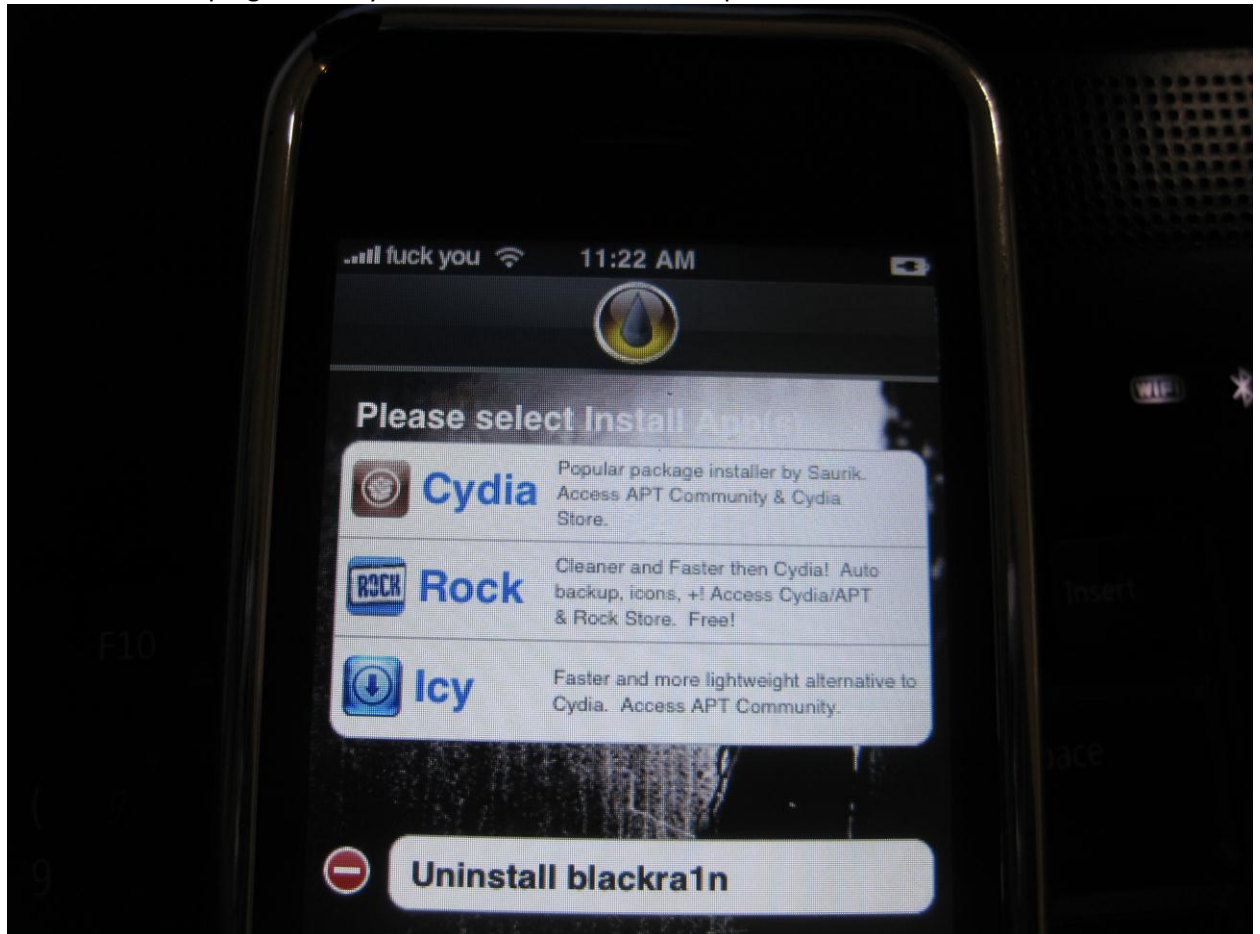

1. Open iTunes with iPhone connected to computer.
2. Manually put iPhone in DFU mode
(You do this by turning off your iPhone while it is connected via USB. Once it's off wait at least 3 seconds then press and hold the power button and home button together. You will hold these for about 10 seconds as soon as the apple logo shows up let go of only the power button and keep holding the home button. Keep holding the home button until you see on the iPhone screen with an iTunes logo and a little USB cord)
3. start task manager

4. click on process Tab
5. First right click on ipodservices.exe and select end process tree.
6. Second right click Itunes.exe and end process tree
7. Run blackra1n.exe
8. Wait for picture to load then wait about 10 seconds
9. Then press and hold just the power button till you see the little working circle near the bottom of the screen. It will reboot by its self my 3 iPhone 3g's took about 3 min to reboot on their own.
10. Enjoy

Now that we have your iPhone jailbroken with blackrain you will now need to install Cydia you will do this by using the blackra1n app that is now on your iPhone.

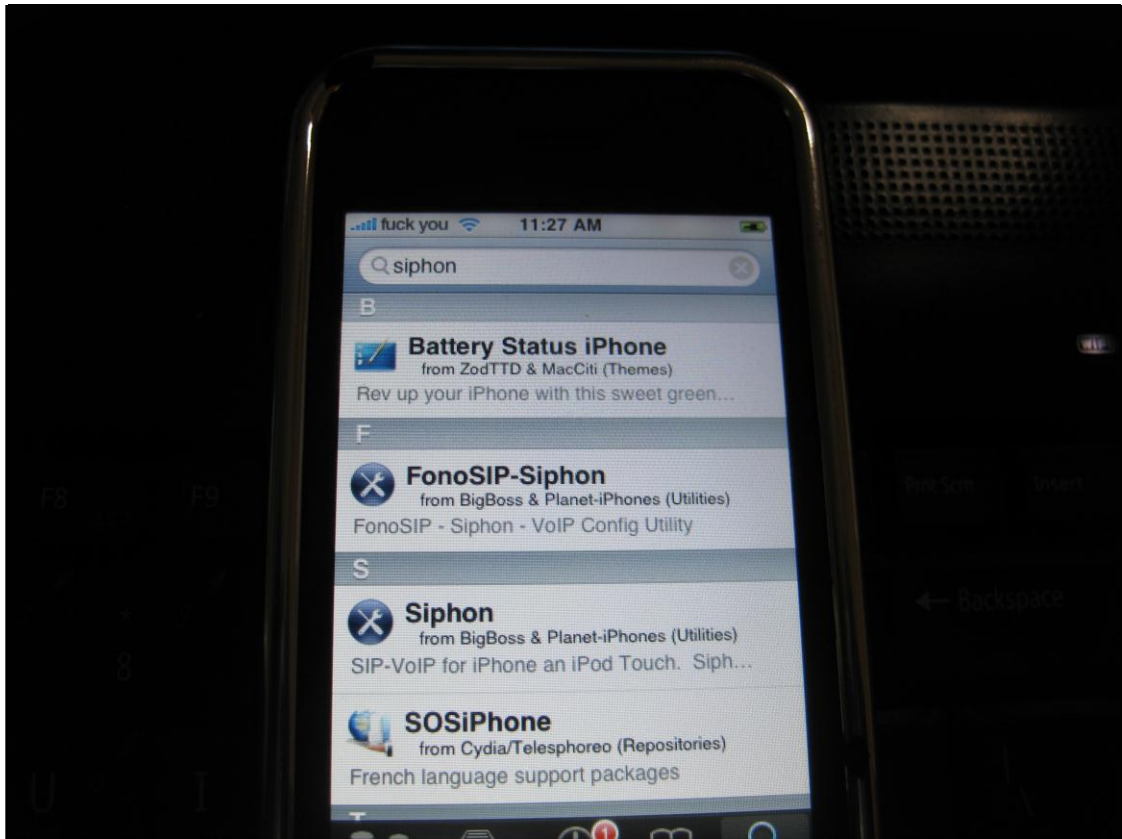

You just click the blackra1n icon then from the next screen you will just click Cydia a little check mark will show up right next Cydia then click install at the top of the screen.

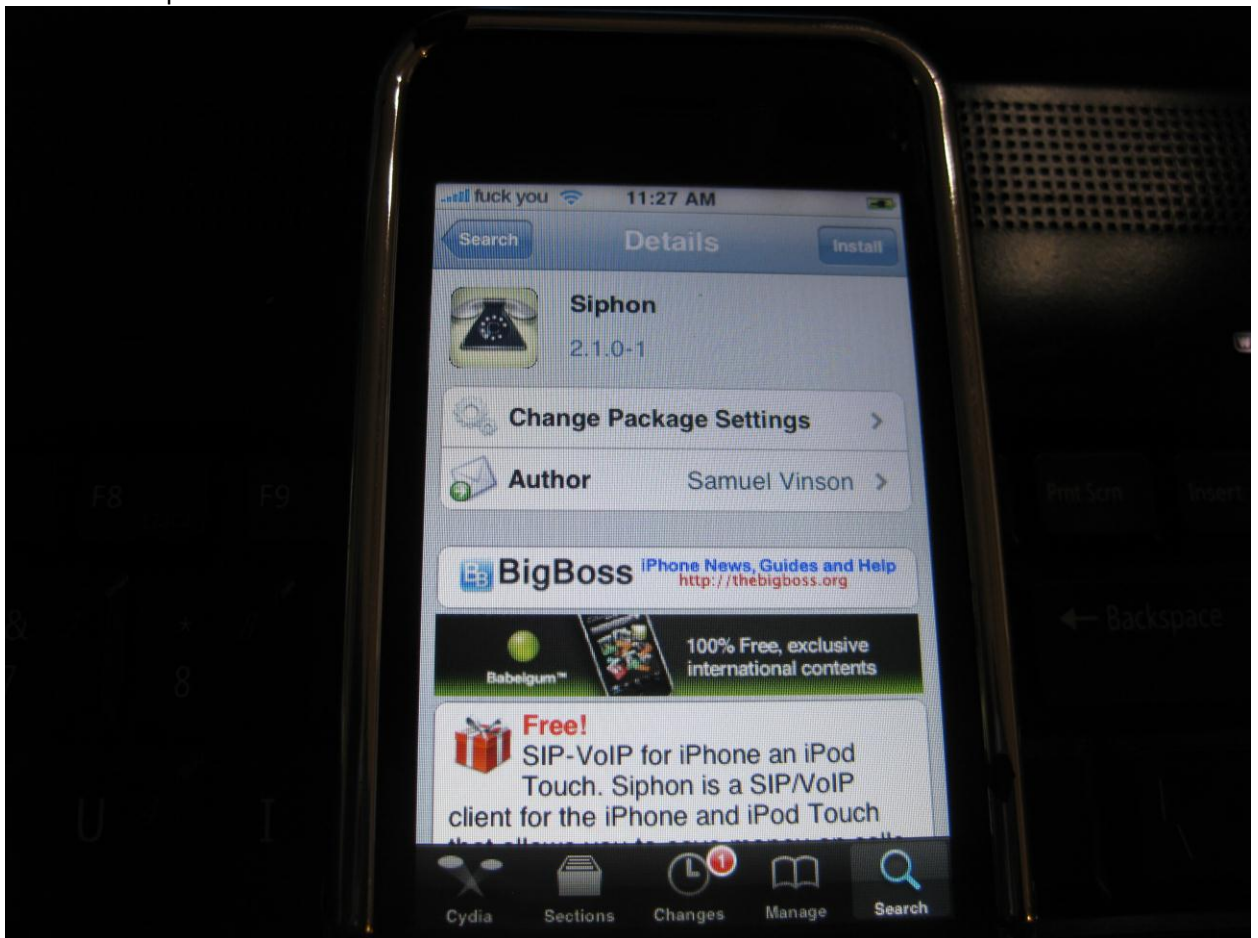

Now That we have Cydia installed we are going to launch it on first launch its going to ask you what type of user you wish to be, simply just select the first option. Now you will need to wait a few min while the program downloads all the latest file, after about 2 or 3 min the Cydia is going to ask you if you would like to update. All you need to do when his pops up is select "Upgrade essential" let it upgrade once it's done it will ask you to restart the program do so.

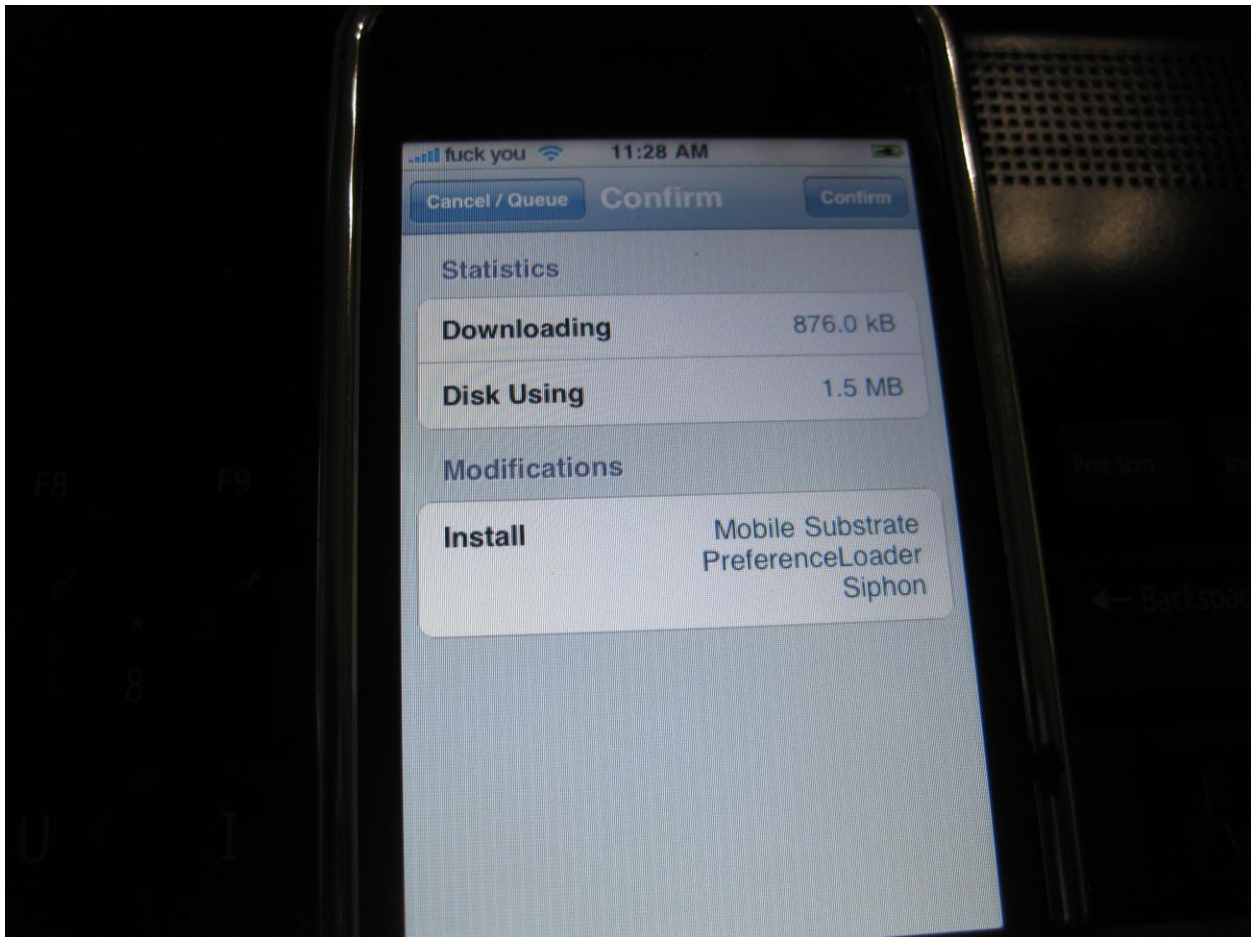

Now we have an upgraded Cydia its time to install the siphon program on the bottom of the screen in the Cydia program there is a button called "search" click it. In the top text entry box type "siphon"

Now Select Siphon from the results.

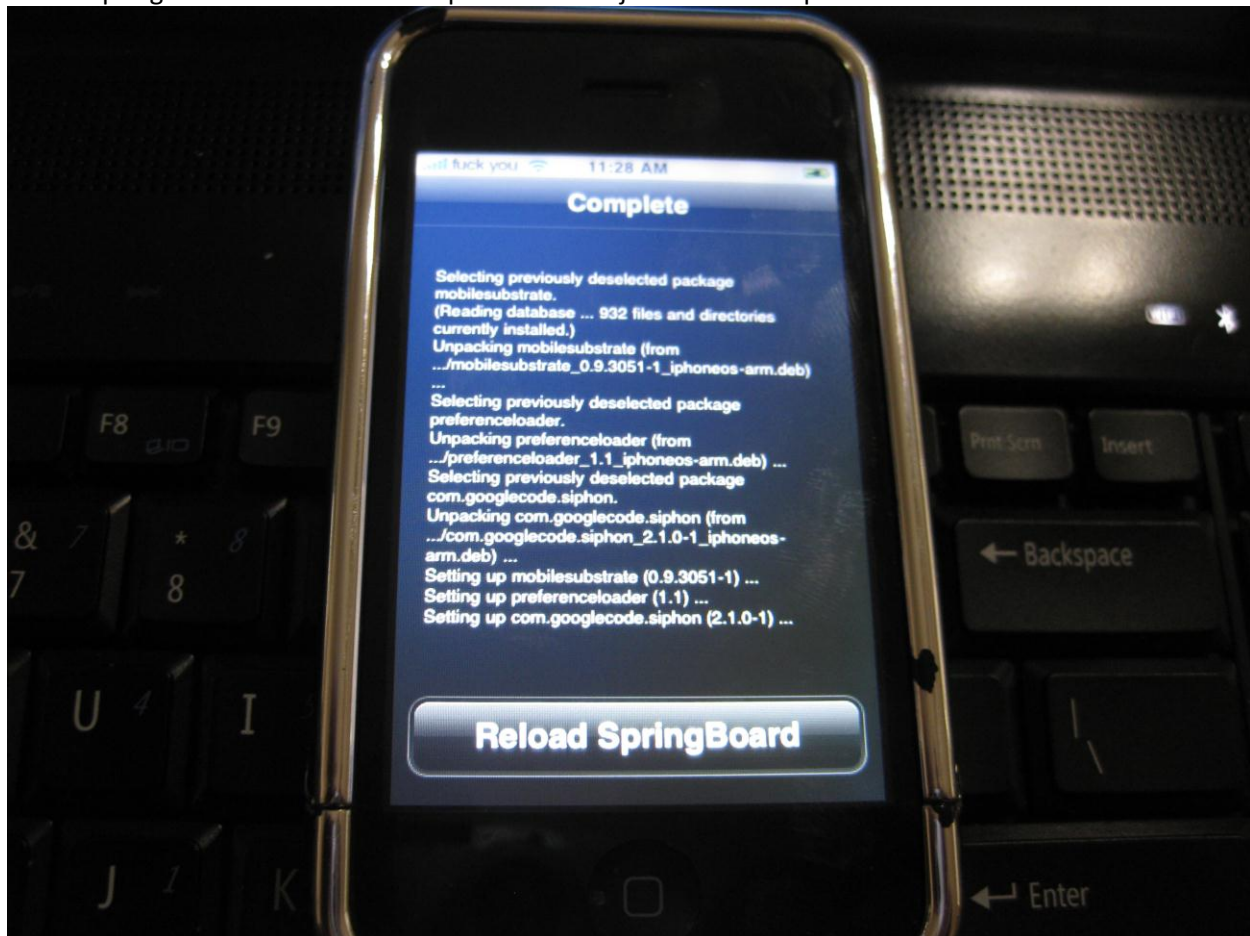

And click the install button near the top right of the screen.

Then click the confirm near the top right of the screen, Cydia will do its thing and install the application once it's done you will get a screen that looks like this. I'm not sure why but when you click

reload springboard it seems to lock up the iPhone I just restart the phone from this screen.

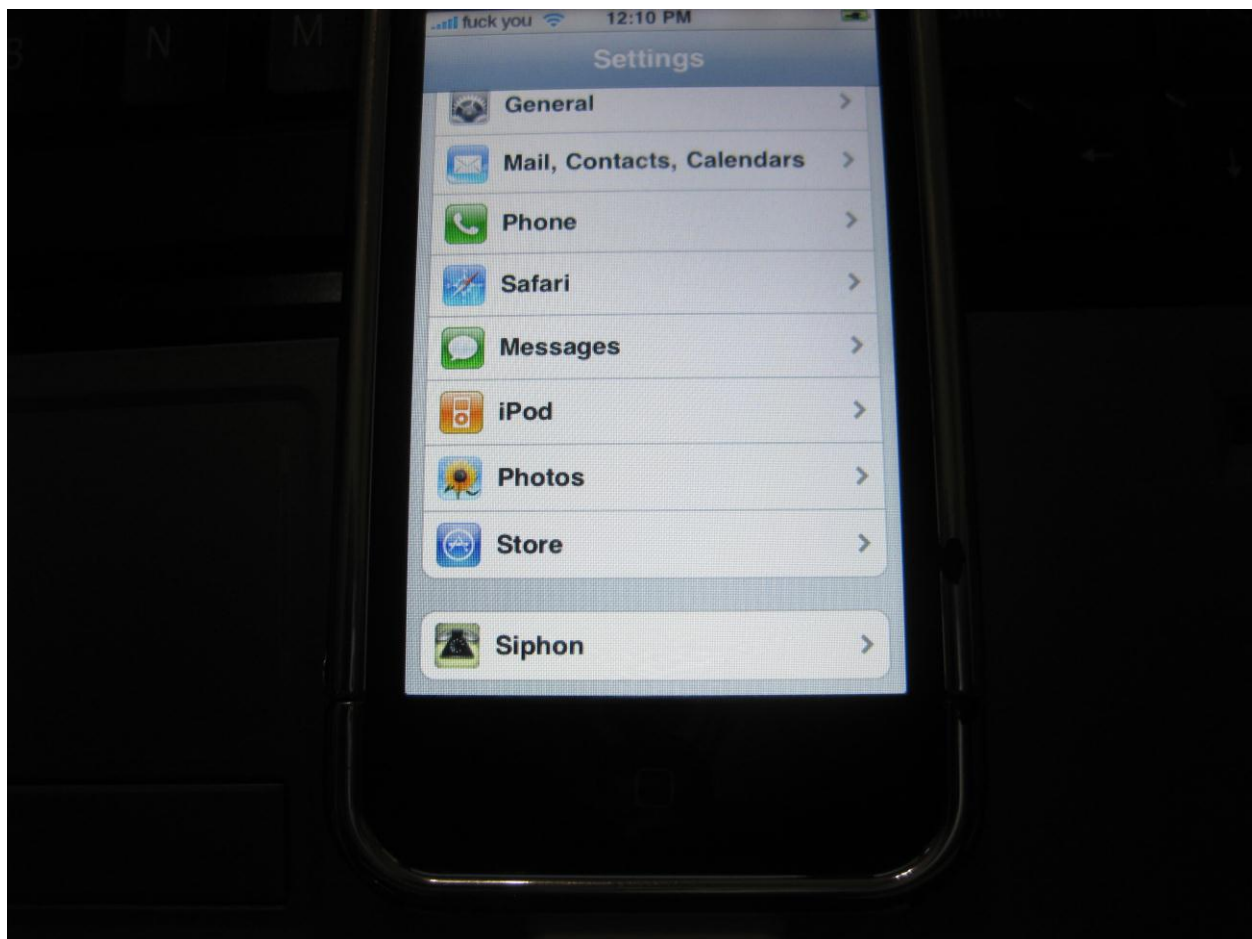

Ok we are done with the iPhone for the next few steps now we are going to use sip password finder v2.2 for obtain our Sip user name and password. Simply download the file and unzip it to your desktop

1. First plug in your magicjack and allow it to load all the way to the ready status
- 1.5 download Sip password finder and unzip it to your desktop
2. Then start a command prompt (you do this by clicking windows start button, then going to the run option and typing CMD.)
3. Now that CMD screen is up just navigate to the desktop where you unzipped the Sip password finder. You do this by typing "cd Desktop" without the quotes
4. Type the letters "PM" and don't press enter yet.
5. Right click the MJ icon in the right hand tray
6. Go to Advanced user in the menu and click restart MJ

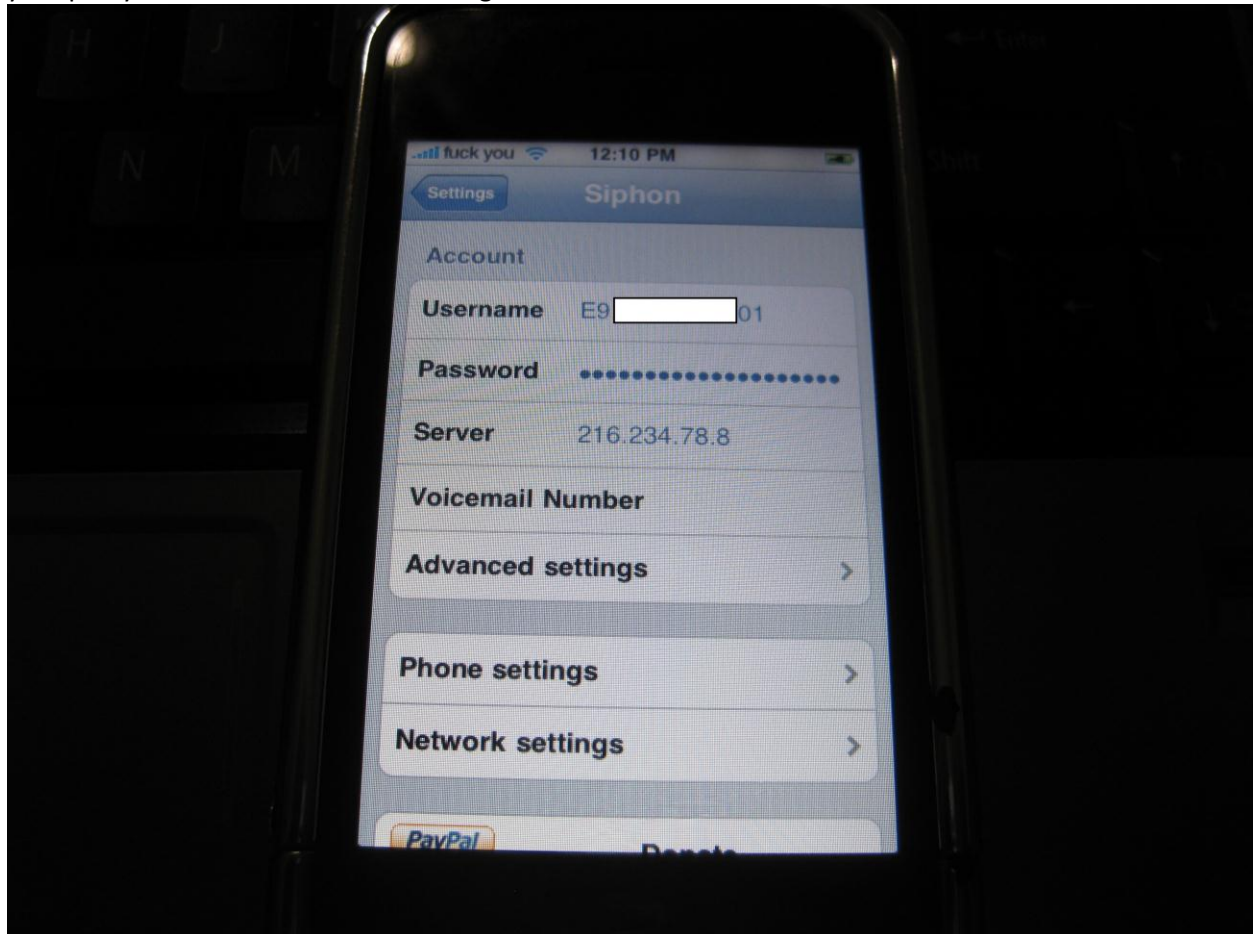

7. Now click the CMD window (so that is selected and ready for you to press enter) and wait for MJ to load
8. Right when your phone number shows up hit enter and let it do its thing
9. You can use this tutorial to identify your proxy if you don't know what it is <http://www.dslreports.com/forum/r20951179-How-to-find-and-change-which-proxy-you-are-using> (You only need to follow that guide until you have obtained the IP of the proxy that your magicjack is currently using)

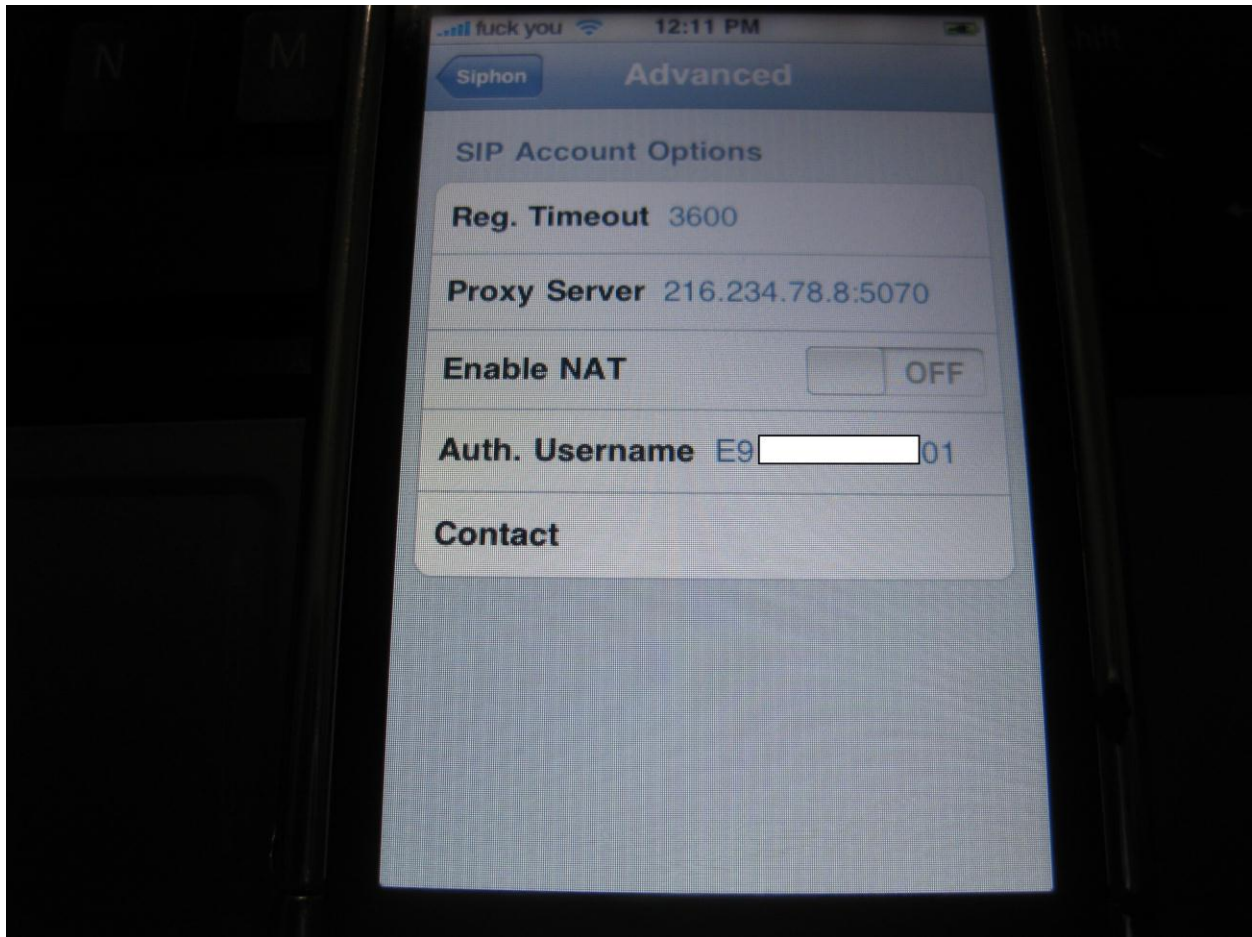

You will notice that when it outputs your password it has 17 passwords with about 10 that are the same and 7 that are wrong. The one that is repeated the most is your password you will see your username displayed below the passwords.

Ok Now that we have the sip information we are going to plug this information into the correct fields on our iPhone. From the home screen select the settings button and scroll all the way to the bottom and you will see the siphon icon select it.

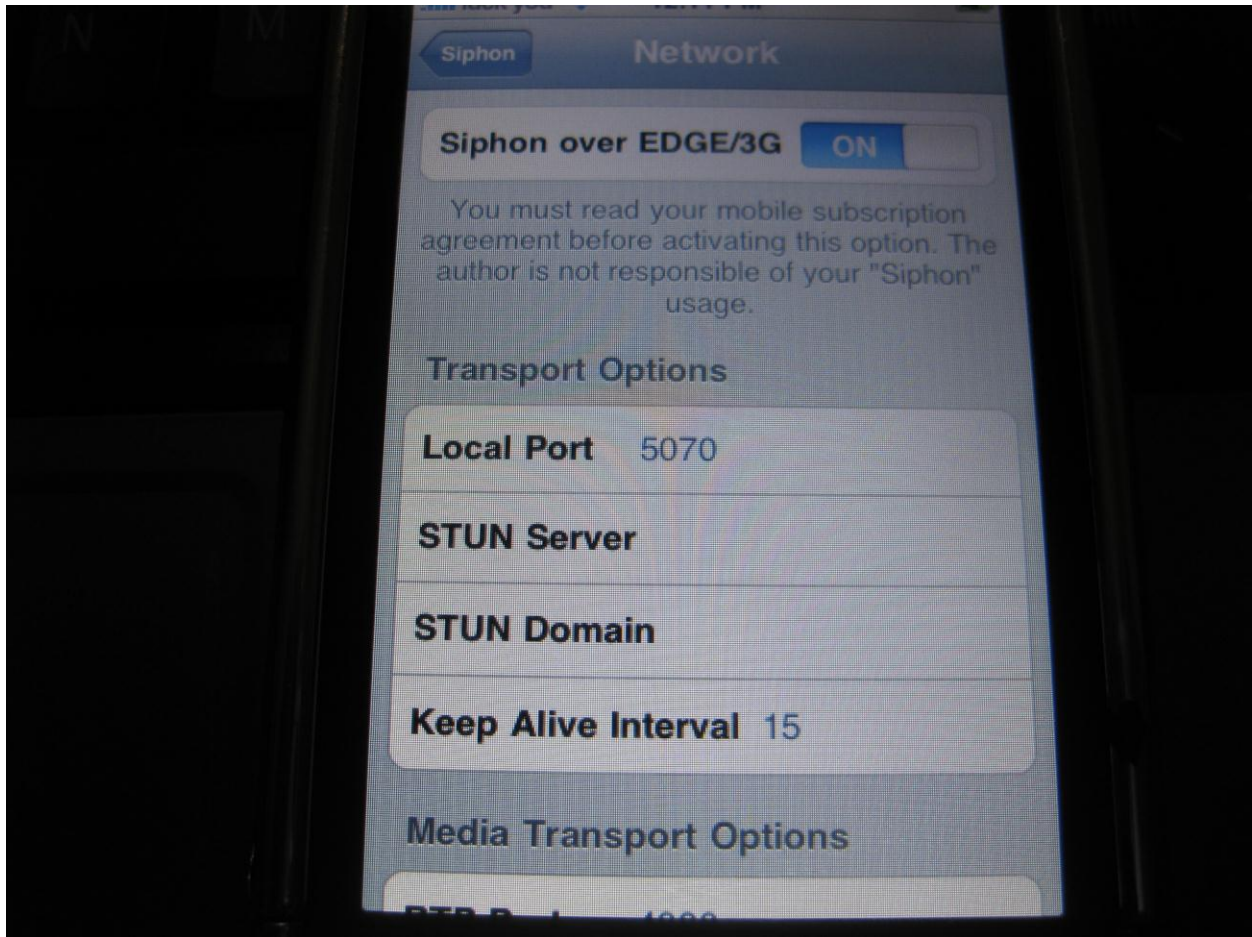

First Screen that you will see looks like this make it look like mine the server IP number will be the one of your proxy. Next Select advanced settings button.

After that's set up you will need to go back to the main settings page of the siphon then select the network button.

That's it its configured there isn't anything else to do press the home button and start the siphon application. There isn't any trouble shooting because I haven't ever had it not work, if it doesn't work then you have a then you have an old magicjack and require your account to be pushed through MJMD5.
